

SAPA Explores the Integrative Evolution of Architecture In New Documentary Series

We have come a long way since one person would design an entire city, or when carefully crafted ornaments on columns and doors were the only integrative aspects of building. Today, as architecture finds itself at the creative interface between a multitude of disciplines, SAPA's new video series will take a deeper look at what industries are influencing the field, and what developments to expect in the years and decades to come.

And with that, important questions arise: Is sustainability becoming the main driver of design? What building materials will dominate an architectural landscape increasingly centered on health and safety? And how will the advent of virtual and augmented reality affect how we plan the construction of buildings and cities?

In search of answers, the SAPA team has traveled around Europe to meet with the people at the forefront of architectural, design and technological innovation. The first episode, set in Stockholm, will be released on Februari 21st.
